Meeting records 📄 Transcript 🔴 Recording

## Summary

### Integration Goals and Team Setup

The meeting formally began with the agenda to recap the previous discussion, focusing on Mulesoft's role in reducing operational risk, improving order-to-cash automation, and enabling internal integration ownership.

### Centralized Architecture Solves Fragmentation

The current architecture suffers from fragmented, point-to-point integrations leading to complex and unmanageable business logic. Mulesoft addresses this via a composable API architecture, providing a single pane of glass for all integrations and demonstrating the capability to handle complex requirements like address normalization and merge resolution events.

### Pricing and Positive Technical Feedback

The platform received positive technical feedback, confirming it covers most immediate integration use cases and feels simpler to develop on than existing tools. The proposed annual investment for the Mulesoft platform, including 50 flows and 5 million messages, was presented at a discounted rate of \$30,000

## Details

### Decisions

Rate these decisions: [Helpful](#) or [Not Helpful](#)

ALIGNED

### Anyoint Platform Annual Investment

Annual investment established at \$30,000 for Anyoint Platform package. Package includes 50 flows, 5 million messages, two pre-production, two production managed APIs.

### Annual Contract Renewal Uplift

Annual renewal rate based on \$30,000 investment price point. Future renewals subject to standard 9% standard Salesforce uplift.

### Free Premier Success Inclusion

February contract includes free Premier Success access package. Support included throughout Mulesoft contract duration, covering 24/7/365 support, health checks, expert coaching.

### Implementation Partner Introduction Scheduling

Introductory meeting with implementation partner scheduled for Thursday morning. Partner will review implementation requirements before further contract movement.

*More details:*

- **Initial Introductions and Regional Weather Updates:** The meeting began with introductions and a discussion of the current weather conditions, noting that someone in SF-Tower (23, C03) was keeping warm and dry in San Francisco, which was expecting rain for nine days. Paris Thomas mentioned that they were snowed in at Tahoe, having received a foot and a half of snow in the last 24

hours, with the snow expected to continue for two more days ([00:00:00](#)). Rodrigo Zyrus, Paris Thomas, and someone in SF-Tower (23, C03) all expressed their fondness for Tahoe, with Rodrigo Zyrus mentioning they often stay in the downtown area, formerly the Hard Rock, now the Golden Nugget, for gambling opportunities ([00:00:56](#)).

- **Tahoe Skiing Experiences and Road Closures:** Paris Thomas, who was raised in the area and skied Northstar, recently skied Heavenly for the first time and was impressed by the lake views ([00:00:56](#)). They expressed disappointment that the roads were closed, preventing them from returning. Following the casual conversation, someone in SF-Tower (23, C03) welcomed Alex Ichikawa and initiated the formal part of the meeting, asking Paris Thomas and Sam McKay to proceed with their presentation ([00:01:47](#)).
- **Meeting Agenda and Introduction of Key Personnel:** Paris Thomas outlined the agenda, which included a recap of the last call, a stage setting for Sam McKay's presentation, a product demo, pricing information, and discussion about partner shopping ([00:02:45](#)). The team consists of Tito (Corey, managing Salesforce for Zyrus), Paris Thomas (MuleSoft Account Executive on the data foundations team), and Sam McKay (Solutions Engineer and MuleSoft expert). The ultimate goal of the project is to reduce operational risk, improve order-to-cash automation, and enable internal ownership of integrations ([00:03:41](#)).
- **Current Architecture Challenges and Mulesoft's Value Proposition:** The current architecture is fragmented, using different tools for integrations, which results in complex business logic and a lack of standardization ([00:03:41](#)). Mulesoft aims to address these issues by providing seamless integration across key systems like HubSpot, Microsoft Dynamics, and Shopify. This integration is intended to lead to stronger revenue, improved customer experience execution, and a solid foundation for the IT team, including Rodrigo Zyrus and Alex Ichikawa, for managing systems and data flow ([00:04:51](#)).
- **Technical Requirements for Scalable Integration:** Mulesoft is intended to provide a scalable foundation by standardizing integration in one place across the platform. Technical requirements include options for batch and real-time data triggers, and the ability to orchestrate existing business logic in a scalable way ([00:05:58](#)). Sam McKay then started the platform discussion, noting that growing organizations often accumulate a thousand or more applications, leading to "API sprawl" without a centralized middleware ([00:07:20](#)).

- Addressing Point-to-Point Integration Challenges:** Organizations often come to Mulesoft after building "point-to-point integrations," which are difficult to troubleshoot because the necessary code (e.g., for syncing HubSpot and Microsoft Dynamics records) is scattered across multiple systems. This fragmented architecture, often referred to as "spaghetti code," makes debugging and tracing data flow nearly impossible ([00:08:21](#)). Mulesoft offers a solution by providing a single pane of glass for all integrations ([00:09:23](#)).
- Mulesoft Platform Pillars and Components:** Mulesoft focuses on building integrations the right way by providing a centralized user interface where all logic resides, simplifying troubleshooting and data flow visibility. Other pillars include automation via no-code tooling and AI-supported development, and API management for 24/7 monitoring of throughput, latency, and data flow ([00:09:23](#)). In the future, Mulesoft can also enable AI agents to leverage the same applications and integrations to take action on end systems ([00:10:23](#)).
- Anypoint Design Center and Exchange for API Development:** API development begins in Anypoint Design Center, which is used to create API documentation, define endpoints, and create mock requests and responses for parallel team development ([00:10:23](#)). Once designed, the API is published to Anypoint Exchange, which functions as an internal "app store" for integrations, promoting reusability and allowing developers to leverage existing APIs instead of building from scratch ([00:11:22](#)). The core idea is to develop reusable building blocks that can be applied to future integrations ([00:12:22](#)).
- Anypoint Studio and Data Transformation:** Implementation of the API integration happens in Anypoint Studio, the desktop IDE development environment ([00:12:22](#)) ([00:14:31](#)). Within the studio, the DataWeave connector is used to map data between systems through a drag-and-drop experience. DataWeave interprets both the incoming and outgoing data structures, simplifying the process of mapping fields from one system (e.g., Shopify) to another (e.g., Microsoft Dynamics) ([00:13:36](#)). Anypoint Studio has been the long-standing development environment, though newer VS Code plugins offer AI-supported development and are also perfectly valid for Mulesoft applications ([00:14:31](#)).
- Monitoring and Alerts in Anypoint Platform:** Anypoint Monitoring and Analytics provides out-of-the-box dashboards for monitoring integrations, allowing users to track total requests, identify erroring endpoints, and check response latency. The platform offers dozens of metrics and provides real-time alerts if a system is down or if a high number of errors occur within a short time frame ([00:15:31](#)).

- Mulesoft Connectors for Specific Use Cases:** Anypoint Studio includes numerous out-of-the-box connectors to simplify interaction with common systems. Relevant connectors for the team's needs include those for Microsoft Dynamics FO and Shopify ([00:16:30](#)). While there is no pre-built connector for HubSpot, the Anypoint HTTP connector can be used to set up the connection using HubSpot's REST API ([00:17:28](#)). Once configured using the HTTP connector, the HubSpot API can be published to Exchange for future reuse, functioning as a custom connector ([00:18:34](#)).
- Future State: Customer and Contact Synchronization:** The future state for the customer and contact sync between HubSpot and FO can have two entry points: a scheduled batch process for bulk updates and a real-time sync button. Mulesoft would query HubSpot for records based on criteria like a certain life cycle stage and modification since the last job run, preventing unnecessary API calls ([00:19:42](#)). The process involves querying FO for matching records, mapping the data with DataWeave, and then upserting the record into FO, followed by stamping the new FO ID back into HubSpot for record linkage ([00:20:43](#)).
- Future State: Order Synchronization and Address Normalization:** The order synchronization process between Shopify and FO is triggered by a new order created in Shopify. Although complex address normalization logic was presented in a previous flowchart, Sam McKay confirmed that all the necessary logic, including complex business rules and if-else conditions via a choice router component, could be handled in Mulesoft using DataWeave ([00:21:43](#)). After querying FO for the record using the normalized address and creating the order, the FO order ID is written back into Shopify to maintain system linkage. Mulesoft can also capture status updates (e.g., delivered or fulfilled) from FO in real time or via batch job and write them back to Shopify ([00:22:49](#)).
- Future State: Handling Merge Resolution Events:** To address concerns about maintaining external system links during HubSpot record merges, Mulesoft can be configured to listen for the HubSpot merge event ([00:22:49](#)). When the merge event is received, Mulesoft takes the final merged record and the IDs of the records merged into it, then extracts any external IDs (like FO or Shopify IDs). This ensures those external IDs are stamped onto the final merged record in HubSpot. Alex Ichikawa asked if this could also trigger a merge in FO, and Sam McKay confirmed that Mulesoft could take action in FO to merge related records there as well ([00:23:56](#)).

- Future State: Customer Tag Sync for Pricing and Sales Agreements:** The customer tag sync for pricing and sales agreement updates can be authored or updated in either FO or HubSpot. Mulesoft would capture these updates in real time or via a batch job ([00:24:48](#)). The platform would then query Shopify to find the related customer record and update any sales agreement tags or other terms in Shopify to ensure synchronization across systems ([00:25:49](#)).
- Mulesoft API Architecture (Composable Architecture):** To contrast with the "spaghetti code" model, Mulesoft promotes a composable API architecture ([00:25:49](#)). This architecture follows three layers: the System Layer, which connects directly to end systems like HubSpot without business logic; the Process Layer, which contains the application's "brain" and holds business logic such as address normalization and merge resolutions; and the Experience Layer, which receives external events or callouts, such as a HubSpot merge event ([00:26:49](#)). This structure promotes significant reuse as new integrations are added ([00:27:56](#)).
- Positive Feedback on Platform Suitability and Ease of Use:** Rodrigo Zyris confirmed that Mulesoft is exactly what they are looking for, covering most of their immediate use cases ([00:28:56](#)). The platform feels robust and much simpler to develop on compared to their current tools. Rodrigo Zyris specifically liked the ability to get analytics and tracking ([00:29:49](#)). They acknowledged that specific caveats would be defined later when working with an implementation partner. Rodrigo Zyris requested a brief live look at the platform for curiosity ([00:31:12](#)).
- Platform Demonstration Walkthrough:** Sam McKay provided a live walkthrough of the API life cycle, starting in Design Center where an API specification is mocked up, defining endpoints and example responses ([00:32:13](#)). Once published, the API goes to Anypoint Exchange, acting as an app store for developers to find existing system APIs and documentation ([00:33:29](#)). After implementation in Anypoint Studio, the API is deployed to Runtime Manager, where it is running and monitored for metrics like request count and response time ([00:34:18](#)). For security, API Manager is used to apply policies like rate limiting, IP whitelisting, and OAuth enforcement to managed APIs ([00:35:15](#)).
- Pricing and Contract Details:** Paris Thomas presented the proposed pricing for the Anypoint platform, listing the cost at \$42,000 annually, reduced to a \$30,000 annual investment due to an initial 28.6% discount. This package includes 50 flows, 5 million messages, and two pre-production and two production managed

APIs ([00:38:59](#)). This discounted rate is the locking rate, though Salesforce has a standard 9% uplift on renewals ([00:44:22](#)).

- **Capacity and Message Explanations:** Sam McKay clarified that a "flow" is a pipeline moving a certain type of data between systems, and the 50 flows are generally split across pre-production and production environments ([00:41:27](#)). A "message" is counted every time a flow is triggered; for instance, a batch job running hourly, even if it picks up 1,000 records, counts as only one message. A "managed API" is one to which security policies (e.g., client ID enforcement) are applied, and two pre-production and two production managed APIs should be sufficient for the current use cases ([00:42:31](#)). The package includes all relevant connectors, with no limit on the number of non-premium connectors used ([00:43:29](#)).
- **Training and Premier Success Promotion:** Regarding training resources, the team noted that there are free Trailhead courses for learning the Mulesoft platform fundamentals, which can prepare developers for certification ([00:40:17](#)) ([00:45:31](#)). A February-only promotion offers free access to Premier Success, which typically costs 30% of the contract price ([00:38:59](#)) ([00:47:32](#)). Premier Success offers 24/7/365 unlimited support, health check assessments, and expert coaching sessions, and Paris Thomas confirmed it would be included for the duration of the initial contract ([00:46:31](#)). This support is especially valuable after implementation for leveraging best practices and planning future integrations ([00:47:32](#)).
- **Next Steps and Partner Engagement:** Rodrigo Zyrís requested the quote in PDF documentation, and asked to be put in contact with a partner for the initial implementation ([00:48:29](#)). They need to meet with the partner first to ensure alignment on their specific requirements before moving forward with the contract in February ([00:49:27](#)). Paris Thomas confirmed they would send over a draft quote and coordinate an introduction with a partner, potentially scheduling a meeting for Thursday ([00:48:29](#)) ([00:49:27](#)).

## Suggested next steps

- ☐ Rodrigo Zyrís will have an answer by the end of the week.

- ☐ Paris Thomas will put a hold on the calendar for Thursday from 9:00 a.m. to 12:00 p.m. to check the partner team's availability for a call.
- ☐ Paris Thomas will send a solidified time for a meeting with the partner on Thursday and send the draft order form to Rodrigo Zyris and Alex Ichikawa.

*You should review Gemini's notes to make sure they're accurate. [Get tips and learn how Gemini takes notes](#)*

*Please provide feedback about using Gemini to take notes in a [short survey](#).*

# Zyris + Salesforce - Transcript

00:00:00

**SF-Tower (23, C03):** Let me turn up the volume a little bit. Hi, Rodrigo. How are you?

**Rodrigo Zyris:** I'm doing good. How are you,

**SF-Tower (23, C03):** Good.

**Rodrigo Zyris:** sir?

**SF-Tower (23, C03):** Uh, keeping warm over here. Trying to stay dry here in San Francisco. We're going to we're going we're expecting rain for the next 9 days, which here in California we need. But uh Paris, you were telling me you're in snowed in and Tahoe.

**Paris Thomas:** Yeah, it's pretty crazy. We have had a high season for the most part. I think we got like maybe five days of snow since December and then it just completely dumped. We got foot We've had a foot and a half in the last 24 hours. It's coming down out there.

**Sam McKay:** It's still going.

**Paris Thomas:** Oh, yes. It's going to be going for like two more days,

**Rodrigo Zyris:** Yeah.

**Paris Thomas:** too.

**Sam McKay:** Oh my

**SF-Tower (23, C03):** Yeah,

**Paris Thomas:** Yeah, we

**SF-Tower (23, C03):** as long as it's as long as it's raining here in San Francisco,

00:00:56

**Sam McKay:** gosh.

**Paris Thomas:** have

**SF-Tower (23, C03):** it's snoring. It's snowing in in Tahoe. Uh I I love

**Paris Thomas:** Exactly.

**SF-Tower (23, C03):** Tahoe.

**Rodrigo Zyris:** Yeah.

**Paris Thomas:** It's the best.

**Rodrigo Zyris:** It's my favorite place in California.

**Paris Thomas:** Is it really?

**SF-Tower (23, C03):** Yeah.

**Paris Thomas:** It's my favorite place,

**Rodrigo Zyris:** Yeah.

**Paris Thomas:** too. Where do you usually go,

**Rodrigo Zyris:** Uh,

**Paris Thomas:** Rodrigo?

**Rodrigo Zyris:** usually I stay at the used to be the hard rock, now is the the golden nugget, you know,

**Paris Thomas:** Okay.

**SF-Tower (23, C03):** Yeah.

**Rodrigo Zyris:** because I like gambling too. So I take the opportunity.

**SF-Tower (23, C03):** Yeah. The downtown the downtown area is

**Rodrigo Zyris:** So

**Paris Thomas:** Good.

**SF-Tower (23, C03):** nice.

**Rodrigo Zyris:** yes.

**Paris Thomas:** I um I was pretty much like raised up here and always skied Northstar. My family were in Truckucky, so more of a Northshore gal, but I actually went and skied Heavenly for the first time like two weeks ago and just so

**SF-Tower (23, C03):** Are

**00:01:47**

**Paris Thomas:** amazed. It is gorgeous. I cannot believe the views of the lake and the nature. It's it's really incredible. So, I was kind of bummed that I won't be getting down there because everything is closed, all the roads. But next time,

**SF-Tower (23, C03):** you really bummed?

**Paris Thomas:** no.

**SF-Tower (23, C03):** I wouldn't

**Paris Thomas:** I mean, yeah.

**Rodrigo Zyris:** What?

**Paris Thomas:** So sad.

**SF-Tower (23, C03):** be.

**Paris Thomas:** I really wish it was in the rainy tower right

**SF-Tower (23, C03):** It's awful over here.

**Paris Thomas:** now.

**SF-Tower (23, C03):** Hey, Alex. How are you?

**Alex Ichikawa:** Hi. Doing good.

**SF-Tower (23, C03):** Staying dry.

**Alex Ichikawa:** Yeah.

**SF-Tower (23, C03):** Awesome. Well, hey, um, you know, I I I think we can jump right in. Paris and Sam. Um, you know, I want to let you guys um go ahead and present what you guys want to present. Um, I'm just going to be in the background if if if I'm needed for any questions.

**Paris Thomas:** Perfect.

**00:02:45**

**Paris Thomas:** Sounds good. Um, Rodrigo, Alex, anything you guys want to address before we jump in or are we all

**Rodrigo Zyris:** No,

**Paris Thomas:** good?

**Rodrigo Zyris:** I think we're good. We're curious to see the tool.

**Paris Thomas:** Yeah. Great. Well, um, I will go ahead and start sharing my screen here. Give me two seconds. Awesome. and we'll start a slideshow. Um, thank you guys for jumping on today. Just for a quick agenda, we'll just kind of walk through a recap of everything that we heard on our last call, set the stage a little bit for what Sam's going to show, and then he'll walk through some product and platform information, jump into a demo. We'll come out of that. We have some pricing for you. I know that we talked about getting those numbers in front of you, and if everything's looking good, then we'll take it from there. and we're shopping around with some partners for you all as well on the back end.

**00:03:41**

**Paris Thomas:** Um, does that sound good for an agenda? Do we need anything else today?

**Rodrigo Zyris:** I think sounds

**Paris Thomas:** Great.

**Rodrigo Zyris:** good.

**Paris Thomas:** Well, you know the team at this point, Tito, of course, he's your Corey, so managing all things across the board for Zyrus as it relates to Salesforce. myself I'm a muleoft ae a part of our data foundations team and Sam is my solutions engineer and the expert on all things mulesoft. So just to run through a quick kind of level executive summary, make sure that we're aligned on what the ultimate goal of this project is. At its base, kind of the value that we're looking to get out of this overall project is to reduce that operational risk, improve the order to cache automation, and enable internal ownership of integrations. Why does this matter? because right now it's pretty fragmented across your architecture using a couple of different tools to do those integrations changes that are happening in the systems that you're using. In the back end of that, there's some complex business logic across systems which Sam will talk about today and how Muoft can support that as you make a transition.

00:04:51

**Paris Thomas:** um trying to just reduce some of those complexities and help with the data governance and visibility across the gaps of where data is flowing between systems. And this in turn is also leading to a lack of standardization. Hence the reason why we're here having this conversation for that future innovation and for what integrations will look like moving forward. Any problems we're missing or challenges to the current flow of things?

**Rodrigo Zyris:** No, I think it sounds

**Paris Thomas:** Great. So,

**Rodrigo Zyris:** Yep.

**Paris Thomas:** what we're looking to accomplish with Mulesoft, aside from kind of that value lever, but to break it down a little bit more, is really having that seamless integration across the key systems we've been talking about so far. So, HubSpot, Microsoft Dynamics, and Shopify, and in turn leading to stronger revenue and customer experience execution, making sure that that flow is more seamless and in line with the goals that you have today. Um, and then for yourself, right, Rodrigo and Alex, for the the IT team, making sure that you guys have a foundation and a strategy when it comes to managing these different systems and data flow across the board.

00:05:58

**Paris Thomas:** And then again, of course, to double tap on this problem that we're seeing here today is really making sure that there's that scalable foundation and you have all the tools in place that you need. Thinking just a bit about what those technical requirements are coming out of a tool like MU Mulesoft is being able to standardize your integration in one place across the platform. Having the options for batch and real-time triggers with that data and then also being able to orchestrate the business logic that you have today. Making sure that that's all right but in a scalable way which is what Muelloft offers. I know that was a lot, but making sure that we're all good here and in alignment with what the goals are and how we can help drive that success.

**Sam McKay:** Awesome.

**Paris Thomas:** All right. Well, if there's no thoughts or questions on this, I'm going to stop sharing and I'm going to pass it over to Sam.

**Sam McKay:** Thank you, Paris. Give me one second. Okay, great. So, I'm going to walk through kind of the Mulesoft platform at a high level.

00:07:20

**Sam McKay:** We'll talk about some of the the value ads of Mulesoft and we'll dive into some of the specific features of the platform that uh pertain to the use cases that we've discussed previously and and the uh future state that we'll go through today. So, at a high level uh as organizations grow, they add more and more uh applications into their tech stack. Today we're talking about HubSpot, Shopify, Microsoft Dynamics. Over time, I'm sure that the uh application stack will grow and the need for integrations will continue to grow. Uh normal enterprises as they scale and and reach larger sizes end up with over a thousand different applications. And so when you start connecting uh them via API and integration, we want a one-stop shop to manage all of those integrations so that you don't get what we call API sprawl and integration sprawl across your tech stack. And so this is kind of what it looks like uh when there's not a middleware like Mulesoft in the picture. We see a lot of organizations come to us because they've built out what we call point-to-point integrations.

00:08:21

**Sam McKay:** Meaning let's say for example HubSpot and Microsoft Dynamics, you want records syncing back and forth between them. Now, if you don't have a middleware in the picture and you're building those integrations point-to-point, that code to move those records between uh HubSpot and uh Microsoft Dynamics, it might live in HubSpot. Some of it might live in Microsoft Dynamics. If something breaks, it's difficult to troubleshoot with an architecture like this because you don't know exactly where that code lives that moves that data. And this only continues to grow as you add more and more applications into the mix. You have all these uh different we call it spaghetti code often because the lines just they start blurring together and debugging and tracing the flow of data becomes more and more of an impossibility. So now to talk about uh how Mulesoft helps address those problems uh there's a few pillars with Mulesoft uh that we talk about when it comes to building the integration landscape. Of course the first is building integrations the right way. So we provide a single pane of glass for all of your integrations.

00:09:23

**Sam McKay:** So when you develop integrations with Mulesoft, they all live within the same uh user interface. All the logic of your integrations lives in that interface. So that whenever something uh needs to be troubleshooted, you need to see the flow of data between applications. You're not left wondering which application do I need to jump into to see where that data is coming from. All that management happens within Muleoft. That's where the logic lives. That's where uh the data is extracted and moved between systems. Uh we have automation. So that's our kind of no code tooling. So we have uh AI supported development experiences, no code experiences to allow uh business users to automate things easily. There's API management. So that's once you've developed your applications and integrations, you've deployed them. Now this is monitoring those integrations, making sure the data is flowing seamlessly. This gives you uh a 24/7 look into the flow of data in your integrations. You can monitor how much data is being uh throughput through your applications.

00:10:23

**Sam McKay:** What's the latency looking like? How long is it taking data to move uh around between systems? And then in the future state, uh everyone is of course has AI on the mind. So with a tool like Mulesoft, you're building integrations to unlock your applications. And long term, if you have AI agents in the picture, they can leverage those same uh applications and integrations to uh take action on your end systems. Uh I'll pause there before I go into this uh slide. We're going to get into kind of some of the really specifics of the Mulesoft platform. Any questions so far?

**Rodrigo Zyris:** No, it's

**Sam McKay:** Sweet. Uh so this is uh Anyoint API designer or design center.

**Rodrigo Zyris:** okay.

**Sam McKay:** This is where you start when you're developing an integration in Mulesoft. This is a user interface where you create the documentation for an API. So like the endpoints that it exposes, the functionality uh that it gives you. It also allows you to create uh mock requests and responses.

00:11:22

**Sam McKay:** So when you come into design center and you're uh designing an API for the first time, you get to define what do the responses look like. And even before the API and integration is developed, you can use those mock responses to test it out. So if you're uh developing an integration, teams don't have to wait for each other to complete their work before uh getting to move on to the next step. With these mock responses, they're able to uh leverage leverage those um response structures and build the whole endto-end integration without having to wait for like piece one to be completed and then piece two. Teams get to kind of work on these integrations in parallel. Once an API is designed on API design center, it gets published to Anyoint Exchange. So Anyoint Exchange is kind of like your app store for the integrations that you've developed. So once you've developed an API or integration and published it to Exchange, anyone at your organization who has access to this can search it up, find the integrations that already exist.

00:12:22

**Sam McKay:** So if uh a new requirement comes down the line and something needs to be integrated into HubSpot, someone comes into Anyoint Exchange, they search up HubSpot, they see, oh wow, we've already created an API to bring data into HubSpot. They get to leverage that for this new integration. They don't have to design the wheel from scratch, uh so to speak. The whole idea with this is reusability. We don't want you to develop these point-to-point integrations that just get used once and every time a new integration needs to be developed, it's starting from scratch, you develop it as reusable building blocks. They get published to any point exchange and now you get to reuse them for every integration going forward. Any questions on that before I move on? Okay.

**Rodrigo Zyris:** Nope.

**Sam McKay:** And so then once you've uh you've designed your API now you've published it to exchange the documentation's all there everyone can see it then it becomes about actually implementing that API integration that's where anypoint studio comes in this is the uh development environment for mulesoft APIs uh as you can see it's like connectorbased so we will talk a little bit more about the specific connectors uh that you'll be interested in for your use cases but the one that uh we're focusing on this slide is called the data weave connector that's that transform

00:13:36

**Sam McKay:** message component we're looking at. This is how we take data from one system and map it to the data in another system. So what's really great about data weave is it's able to interpret the structure of data coming in and it's able to uh interpret the structure of the data that needs to go out to the next system. So if you look uh at the bottom of the slide, it's like a drag and drop experience. On the left you have the fields that are coming in to the uh transform component, the data weave component and on the right you have the fields that you need for the outbound uh API call and then it's just a drag and drop. You drag okay this is the field coming from Shopify for example and this is what the name of the field is in Microsoft Dynamics and you just drag and drop it and now it's mapping that field over before it brings that information into the next system. Any questions on that?

**Rodrigo Zyris:** No. Any point studio is the add desktop

00:14:31

**Sam McKay:** Yes. So it's a desktop IDE for

**Rodrigo Zyris:** app?

**Sam McKay:** developing.

**Rodrigo Zyris:** And is it related to the plug-in that you have for VS Code? They're interchangeable or do you use one or the

**Sam McKay:** So we we do have some uh plugins for VS code for like AI supported development.

**Rodrigo Zyris:** other?

**Sam McKay:** So that's just an alternate way to develop mule applications. Um basically they they are interchangeable in that you can develop uh mulesoft applications with both of those environments.

**Rodrigo Zyris:** Yes, but your recommendation would be to use Endpoint

**Sam McKay:** You know we nowadays we see customers uh doing both I would say uh anyoint studio has kind of been

**Rodrigo Zyris:** Studio.

**Sam McKay:** the way for uh a long time. So it's what a lot of our uh customers who have been on the mulesoft platform have uh the most familiarity with it. Uh I coming from a muleoft developer background uh for maybe eight years or so I've been using anypoint studio. Uh but the the VS code plugin the new AI powered experiences those are kind of the uh uh the latest and greatest tools.

00:15:31

**Sam McKay:** So you know I don't want to say hey no I don't recommend using those. Um they're they're they're both uh perfectly valid for developing integrations with Mulesoft.

**Rodrigo Zyris:** Yeah, I understood.

**Sam McKay:** Sweet. This is anypieoint uh monitoring and analytics. So this is basically the dashboards that come available out of the box to monitor your integrations. You get to see the total amount of requests that are coming into your integrations easily monitor uh are any endpoints erroring out. Uh what is the uh response latency? So there's like response times and what we're seeing on this screen is just kind of a subset of the dashboards you can look at. There's like dozens of outofthe-box metrics that you can uh take a look at on these screens. So really, it's just all about monitoring and getting real-time alerts on your data. So if a system is down, say many errors are coming in in a short amount of time because one system in your stack is temporarily unavailable, you'll

see that right away on a dashboard like this.

**00:16:30**

**Sam McKay:** And you can also set up alerts to be sent to you in real time. So you get x amount of uh errors within a certain amount of time, you want to know right away so that you can take a look into your systems, you can get that notification right away and and know about it and take action immediately. Okay, sweet. So, now talking about uh some of the connectors uh that specifically apply to your use cases, um Anyoint Studio has dozens and dozens of out-of-the-box connectors for common systems. So, in your case, uh a couple of those connectors that are highly relevant, we have a Microsoft Dynamics connector for uh FO specifically and other parts of Microsoft Dynamics, but we've been talking about FO a lot. So uh that's a connector you would use to interact with uh Microsoft Dynamics. Pull data out of it, push data into it. Similarly, we have a Shopify connector. Uh again, these connectors are just to simplify interacting with these end systems. So you don't have to build that out of the box.

**00:17:28**

**Sam McKay:** Uh you don't have to build from scratch the like authentication to those systems, implementing the endpoints to access these systems. These connectors abstract all of that hard work away from it. You just need to get your credentials, configure it within the connector, and then you have access to all the API capabilities of those systems. And then another connector I'm just going to touch on quickly is the Anpoint HTTP connector. So, this is a connector for accessing any systems that we don't have an out-of-the-box connector for. So, if you have a a system that there's no built uh pre-built connector for, but it has a REST API, this is the connector that you would use to connect to that system. Makes it very simple to access any existing REST APIs. You just configure the host URL for that system, the endpoint that you're trying to access, and then it's able to call those APIs to push data, pull data, update data, etc. Any questions on the connectors uh before I move on?

**Rodrigo Zyris:** Uh just a question. Do is you have a out of the box H subspot connection right

00:18:34

**Sam McKay:** So, we do not have a HubSpot connector that's pre-built.

**Rodrigo Zyris:** now?

**Sam McKay:** So, for that, you would use this HTTP request uh uh connector. HubSpot has uh tons of out-of-the-box uh API. So, it would be very simple to set up with a connector like this. You would just be putting in the HubSpot host and port and your API credentials and then you would just call those endpoints using this HT HTTP request connector. What's nice uh about Mulesoft is in a situation like this where there's no pre-built connector, you would build out that HubSpot API with this uh HTTP request connector once, then it would get published to Exchange like we were looking at before. And now in the future, any integrations that need to use HubSpot, you essentially have a connector built for it. you built it once using this HTTP request connector, but now going forward, now that it's uh developed and on Exchange, everyone gets to use it as if it were any of those other pre-built connectors. Okay,

**Rodrigo Zyris:** Yeah.

**Sam McKay:** so now I'm going to get into uh some of your use cases that we uh specifically discussed last time and what a future state could look like with Mulesoft leveraging some of these connectors and these capabilities.

00:19:42

**Sam McKay:** Oops, there we go. Uh so we discussed last time a customer and contact sync between uh HubSpot and FO. So this is what that could kind of look like with Mulesoft. Now you'll see there's actually two entry points for this future state flow. One is a scheduled process. So that would be like the batch jobs that we were discussing last time to update records in bulk. Uh and then on top we also have a real-time sync button. So we discussed last time you would want batch for the most part. However, you would also want to have the ability if a record needs to be synced right away, someone just clicks a button in HubSpot and it syncs over to FO automatically. So, what would happen is uh Mulesoft could query HubSpot for uh any of the records that meet the criteria that you care about. So, we tal discussed last time if it's in a certain life cycle stage, then those records should be syncing over into FO. So when we also have queries HubSpot, it could identify records by that lifesty life cycle stage and also check that it's been modified since the last time the job ran.

00:20:43

**Sam McKay:** So you're not just syncing over records uh unnecessarily like, hey, we synced over record A last time. Next time it runs, nothing's changed about record A. Why why uh use an API call to resync that for no reason when it's already updated? So we would query HubSpot, get those records. We would query fo see if a matching record exists already for that one. We would map over the data using that data weave component we were just looking at before. And then we would upsert that record uh into FO. And then once that records upserted into FO, you would have an ID for the record in FO, you would take that ID, you would stamp it back into HubSpot so that next time this runs, once we query that record, we see, oh, it already has a matching record in FO. Now we know exactly what record to update. Any questions on uh this use case or like any thoughts on how this might speed up

**Rodrigo Zyris:** Mhm.

**Sam McKay:** the process?

**Rodrigo Zyris:** No.

00:21:43

**Sam McKay:** Okay. So now this is the uh order syncing that we were uh discussing last time between Shopify and FO. So here we have the trigger being an order being created in Shopify. Now, I know there's that uh somewhat complex address normalization process. You guys sent over the flowchart. I got to take a look at it some of the and see some of the logic involved in uh finding the record when there's multiple records um with the same email but maybe different addresses. I didn't add that complete logic into this process diagram here. I didn't want to uh over complicate the visual here. However, all that logic that you sent over would be able to be done in Mulesoft again using that data weave component. we have a a choice router component for handling if else conditions. So that would all live within that uh address normalization process. We would query fo to find uh the record with that normalized address and then we would create the uh fo order again all following the same uh business logic that you presented in the um flowchart that you sent over and how you're kind of managing that process today.

00:22:49

**Sam McKay:** And then once that's done, you have the uh ID of the uh FO order. You write that back into Shopify. So again, you're always maintaining that link between systems. And then on the bottom, just uh a quick like uh other process that would be implemented is the sync from FO back into Shopify. So that's when uh the status gets updated to delivered or fulfilled, whatever status update you're trying to capture. uh Mulesoft will be able to capture that either in real time or in a batch job and then write it back into Shopify so that those statuses between systems are always in sync. I'll pause there. Uh is this generally meeting the mark on uh where you see the future state of this process?

**Rodrigo Zyris:** Yes. In general.

**Sam McKay:** Great.

**Rodrigo Zyris:** Yes.

**Sam McKay:** Merge resolution was a big one we touched on last time. making sure that when you're merging uh duplicate records in HubSpot, you maintain all the uh ids and links to records in other external systems. So when HubSpot merges uh records, there's something called a merge event that can be fired from HubSpot.

00:23:56

**Sam McKay:** Mulesoft would be configured to listen for that merge event. So when Mulesoft receives that merge event, it gets the uh final record from HubSpot and it also gets the ids of the records that were merged into it. Using that, Mulesoft is able to take a look at all the records involved in this process, make sure it captures any of the external IDs. So, if it's uh if it has an ID for an FO record on it that we want to keep track of, Mulesoft grabs it. If it has uh a Shopify ID for a record, Mulesoft grabs it and makes sure that it stamps it onto the final merged record in HubSpot so that even when you merge these records, you're not losing any of those links to what you've created in other systems. Does that make sense? that that touches uh or captures kind of the concerns around

**Rodrigo Zyris:** Mhm.

**Sam McKay:** merges.

**Alex Ichikawa:** Yeah. Could that also trigger a merge in

**Rodrigo Zyris:** Yes.

**Sam McKay:** Yes. So uh if we wanted to link FO into this process when uh when Mulesoft

00:24:48

**Alex Ichikawa:** FO?

**Sam McKay:** receives this merge event from HubSpot, it can take action in FO. So that can take those it can find the records in FO that are related and it can merge them together into one unified record.

**Alex Ichikawa:** So I ask honey,

**Sam McKay:** Sweet.

**Alex Ichikawa:** honey,

**Sam McKay:** Okay.

**Alex Ichikawa:** why you're putting attack.

**Sam McKay:** And this is for the uh customer tag sync for uh pricing and sales agreement updates that we discussed. So last time we discussed it if I uh if I got it right last time. Um there's some decision- making to be made and whether uh FO or HubSpot would be kind of the source of truth on this process. So I have it written down as the sales agreement can be authored or updated in FO or HubSpot whichever one uh it starts in or both. They can both be uh set up in the integration layer. Mulesoft would capture that uh in real time or via a batch job. Again that's kind of up to you in how you want to uh capture those updates.

00:25:49

**Sam McKay:** Mulesoft can then take the information, query Shopify to find the related customer record and then any sales agreement tags in Shopify, Shopify or other terms that need to be updated as part of that process. Mulesoft goes into Shopify, does all the updates to make sure that everything is in sync between systems. Any questions on this one or any of these other future state uh uh diagrams we've just gone through? I believe that was the last one I had. I'm going to show you one large API architecture diagram right after this, but just want to make sure that we're for the for the most part hitting the mark on these uh use cases and kind of how these future states going to look.

**Rodrigo Zyris:** Yeah, you did capture it. Well, so yeah, in general,

**Sam McKay:** Awesome. Okay,

**Rodrigo Zyris:** correct?

**Sam McKay:** this is the last slide I'll I'll go through and then we'll uh open it up and and

just kind of go into any questions you have. But this is to kind of contrast against the spaghetti code diagram we were looking at at the uh start of the presentation.

**00:26:49**

**Sam McKay:** And this is how uh you could architect this using Mulesoft for your processes. So with Mulesoft we uh try to follow what we call an API architecture architecture or a composable architecture and again that has to do with we want to be able to reuse what we build. So the system layer is for APIs just to connect to your end systems. So, for example, you'll see that I've uh called out the HubSpot system API down here. So, when we were talking about how there's no out of the box HubSpot connector, you would use that HTTP connector to connect to HubSpot and you would package it as a HubSpot system API. That's what gets published to Exchange. That's what everyone gets to use afterwards to connect to HubSpot. At the process layer, that's where any business logic lives. So, system system layer, no business logic. It's just we're going to grab information from a system, we're going to push information into a system. Process layer is where the brain of the application is. So when we were talking about the address normalization process uh or uh querying from multiple records and doing merge resolutions, all that sort of logic lives in the process layer.

**00:27:56**

**Sam McKay:** So you don't that's where you worry about if then logic or what to do in different scenarios. And then in the experience layer, that's where you actually receive uh events or call outs from the outside world, so to speak. Uh so when we're talking about HubSpot, for example, firing a merge event when you merge something in HubSpot, that merge event would be received in the HubSpot events experience API and then it would bubble down into that process layer that's going to then call the system layer to take whatever action it needs to in those end systems. The idea here is as you add more integrations into this picture, as more business processes need to be automated, you have that system layer available. You get to reuse any of those uh system APIs to make it easier to connect to those systems. And then in the process layer, all you need to do is uh rework the mapping or add some business logic for different scenarios, but you get significant reuse out of what you've already built. Awesome.

**Rodrigo Zyris:** Mhm.

**00:28:56**

**Sam McKay:** I'll pause there. Uh that covers kind of everything I want to show in terms of uh the platform. If there's any specific questions you have about what we talked about or thoughts on how this uh would work for your use cases, we'd love to hear it.

**Rodrigo Zyris:** No, I think it's exactly what we are looking for, you know. So, and you cover most of the scenarios that we have any immediate need for. So, yeah, it's good. Looks

**Paris Thomas:** Um, Rodrigo, Alex too,

**Rodrigo Zyris:** good.

**Paris Thomas:** just it sounds like I mean you just said this, right? This is what you guys are looking for, but just kind of going through like walking through what the platform has to offer, the different functionalities, thinking about these flows. Does this feel like the right fit of where you're tracking to go?

**Rodrigo Zyris:** It does. It does. Feels like the right feet.

**Paris Thomas:** Yeah. Is there anything in particular that's kind of standing out about how Mulesoft can support these different

**00:29:49**

**Rodrigo Zyris:** Yes.

**Paris Thomas:** functionalities, these different workflows, um just the the immediate goals that you do have?

**Rodrigo Zyris:** Uh nothing from my side.

**Paris Thomas:** Okay, maybe a followup there like how does this maybe differ from what you guys are doing today and like um where's maybe some confidence coming?

**Rodrigo Zyris:** I think is much simpler to develop than the tools that we currently have. Uh feels more robust. I like the the the the ability to be able to get analytics and tracking of the things that are happening. Uh yeah, since sounds like a good fit thus

**Paris Thomas:** Yeah, great. Well, I appreciate that feedback.

**Rodrigo Zyris:** far.

**Paris Thomas:** And is there anything that we maybe need to do a little bit more additional um covering of or are you feeling good about what we've walked through

today?

**Rodrigo Zyris:** I'm feeling good what we walked through today. You captured the the requirements very well. I know there's a few things like that are caveats that we can define later, but I also understand that we'll be working with a partner to create these initial workflows for us.

**00:31:12**

**Rodrigo Zyris:** So maybe that's when we go deep into the

**Paris Thomas:** Yeah. Okay. Absolutely. Um,

**Rodrigo Zyris:** requirements.

**Paris Thomas:** and we can definitely work on that as part of the rest of this evaluation as you get set up with the partner and they'll help with making sure that all the different little technicalities are showing up. Um, Rodrigo, would it be helpful if we pulled up the actual application and looked at any of it or are you feeling good with

**Rodrigo Zyris:** Uh,

**Paris Thomas:** this?

**Sam McKay:** Sure.

**Rodrigo Zyris:** I would like to see just more for curiosity, you

**Paris Thomas:** Okay, absolutely.

**Rodrigo Zyris:** know.

**Sam McKay:** Just give me one moment. So, what I'll do is I can poke around the platform. Uh it'll it'll basically be just going a little deeper in some of the functionality that I was uh discussing previously. But just to give you kind of a a full life cycle walkthrough of how this works. If I'm a developer, I'm coming in here. I want to develop uh one of those new integrations uh from scratch, maybe the HubSpot API, something like that.

**00:32:13**

**Sam McKay:** It would start in design center where we kind of mock up the API. So, going into here, uh these are just some uh pre pre uh pre-made uh APIs that I've put into Design Center. So, if I open up this one, you can see this is kind of what the API specification looks like. This is for a system called Blackbook, but this could be for any system, you know, for HubSpot, for example. You'd come in here and define what the

API would look like. You define your endpoints. So there's a a post method, but you can create get methods for querying data. Um, and uh delete methods for deleting data, things like that. This is also where you include the example responses for your API. So you get to say this is what the fields are going to be on a response. These are some example values of what they'll look like. So now once you've created this someone could easily take this API specification see what the response structure looks like and they'll they'll understand okay so when I call this API I get these fields back this is what I'm going to have to map to the next system once you've created this API specification you would go and hit publish on it so if I were to go I I've already published it so I'm not going to hit that right now but now if I've published it I go into anypoint exchange this is our app store to see what's been

**00:33:29**

**Sam McKay:** built what's been uh documented already. We have some of these APIs that I've created the specification for before. If I jump into that one we were just looking at. This is where there's some documentation now. So if a developer at your organization wants to see what's been built already, they come into this app store essentially. They say, "Oh, okay. We already have this system API built out. We already have a HubSpot system API that I can use." They get to see the documentation that's available for it, some use cases that uh it might be relevant for. And then they also get to see the endpoints so that they can see, oh wow, this has a post method uh this API. And this is what the request uh type looks like. And here's what the responses look like and the different error codes that can come with it. So this is all to give developers a uh leg up in developing faster. They don't have to wait for this API to be completely developed to start designing around it.

**00:34:18**

**Sam McKay:** They know exactly what it's going to look like once it's complete. Once that's done, we would go into uh Anyoint Studio. I'm not going to pull that up right now, but essentially uh we saw the slide of what that looks like. That's where you develop it. You bring the connectors in. You actually implement the API. Then one once it's complete, it gets deployed to runtime manager. I'll jump in there. You have different environments. You can configure this for a dev environment, a production environment.

I'll jump into one of these. I don't have anything deployed in here at the moment, but this is where you would take uh your completed API and deploy it. So once it's deployed here, then it's running. This is where you would go to look at those dashboards we were looking at before around like how many meth requests are coming in, how many success responses, how long is the um uh response time on those API calls, all that would live inside runtime manager where your integrations live.

**00:35:15**

**Sam McKay:** And then separate from that, we didn't really touch on this in the uh slides, but if you ever want to apply policies to those APIs, so maybe like rate limiting, uh IP whitelisting, like security policies, we have what's called API manager.

**Rodrigo Zyris:** Okay.

**Sam McKay:** That's where you go in here. You can uh add an API to this. So you can you basically uh click add new API. It'll show you the APIs that you have in your system. You click one like I have this API here. And from here I can go into policies and you can add policies to the API. So that's where you're adding like rate limiting, you want client ID enforcement, oath enforcement on your API. Whatever security policy you want, that's where you go in uh into this screen. And it's just about clicking through it. You just click in, you click, okay, I want to apply client ID enforcement to that API. Then you apply it. It's pretty uh seamless process to uh manage your APIs from there.

**00:36:09**

**Sam McKay:** And from there, I mean, that pretty much covers the uh the whole integration API life cycle. So, going forward after that, this is pretty much where you'd be living if you want to monitor those APIs. But the idea with a system like this is once it's set up, once things are configured, it should run smoothly. These things, you live inside HubSpot, you live inside FO, uh the data flows seamlessly. You don't really uh want to have to be coming in here all very often at all because everything should just be uh kind of flowing seamlessly.

**Rodrigo Zyris:** Mhm.

**Sam McKay:** any questions or uh anything else I can uh dive into on

**Rodrigo Zyris:** Yeah. No,

**Sam McKay:** this

**Rodrigo Zyris:** since 4, there's a lot that, you know, we'll be exploring and playing with once we have access to the tool. Uh, yeah.

**Paris Thomas:** How's the kind of look and feel of the platform?

**Rodrigo Zyris:** feels very friendly. You know, I have a development background,

**Paris Thomas:** Okay.

**Rodrigo Zyris:** so I I I kind of know what's going on and but the interface is very friendly.

**00:37:15**

**Paris Thomas:** Okay.

**Rodrigo Zyris:** So,

**Paris Thomas:** friendly good or friendly bad or we like it.

**Rodrigo Zyris:** yeah.

**Paris Thomas:** Okay, great. I'm glad to hear

**Rodrigo Zyris:** Yeah.

**SF-Tower (23, C03):** Hey, Rodrigo and Alex, do you guys happen to have a hard stop?

**Paris Thomas:** that.

**SF-Tower (23, C03):** I just want to make sure. We I know we have about what, seven minutes. I just want to make sure.

**Rodrigo Zyris:** Uh uh not really, but yeah,

**SF-Tower (23, C03):** Okay.

**Rodrigo Zyris:** we can go a few minutes over if

**SF-Tower (23, C03):** Okay. Sorry. Sorry, P.

**Rodrigo Zyris:** needed.

**SF-Tower (23, C03):** I don't know if you have additional questions. I just wanted to make sure and and be respectful of their time.

**Rodrigo Zyris:** Yeah. Uh I have a couple things. Uh how about training? Is there any online resource that we can use like for Alex and Rafael, my developers to get trained on

**SF-Tower (23, C03):** Yeah, that's a that's a great point. We're actually going to touch on that.

**00:38:02**

**Rodrigo Zyris:** that?

**SF-Tower (23, C03):** Um, but Paris, I believe you still had a couple more slides you

wanted to show.

**Paris Thomas:** Yeah,

**SF-Tower (23, C03):** But great point,

**Paris Thomas:** we'll walk through.

**SF-Tower (23, C03):** Rodrigo. We're going to we're going to bring that up right

**Paris Thomas:** Yes,

**Rodrigo Zyris:** All

**Paris Thomas:** absolutely.

**SF-Tower (23, C03):** now.

**Paris Thomas:** Um, any other questions before we touch on that?

**Rodrigo Zyris:** right.

**Paris Thomas:** I just want to make sure that we're clear before we talk about a little bit about pricing and what kind of comes with the platform

**Rodrigo Zyris:** Yeah,

**Paris Thomas:** support perspective.

**Rodrigo Zyris:** that's what I'm curious about. So, that's

**Paris Thomas:** Okay, great. Um, and just before I share that,

**Rodrigo Zyris:** what

**Paris Thomas:** just want to make sure kind of to recap quickly. Everything Sam walked through looks good. The platform looks good. We're feeling pretty confident in what what it can do for you all. Okay,

**Rodrigo Zyris:** Yes.

**Paris Thomas:** great. Wonderful. All right. Well, I will take the screen back here and we'll jump in to this.

**00:38:59**

**Paris Thomas:** Um, okay. So, I'm going to pull up a pricing slide for us here. So, what we are proposing is the Anyoint platform. That's what Sam just walked through. And everything that we talked about today is going to come within the grounds of that platform. uh list cost on this package 42,000 a year. We secured a 28.6% initial discount on this putting the platform at a \$30,000 investment for the year for Cyrus. A couple of functionalities to take away here is being able to support those integrations across HubSpot, Shopify, Microsoft Dynamics, really anything else you guys might want to think about moving over to the platform and being able to really establish that ownership and that centralization of the integrations a little bit on capacity. We can get more into this if it's beneficial to you. I know you have developer background, technically astute with all

of this, but we'll come with 50 flows, 5 million messages, two pre-pro and two prod managed APIs out the gate. Um, and then to your question, Rodrigo, we do have a promotion right now with February contracts where we have free access to Premier Success.

**00:40:17**

**Paris Thomas:** So, this will give you access to our support team and just the ability to learn a little bit more about the platform and how to use it. Um, to answer like other questions, we do have a variety of additional resources as well for helping to educate your team on how to use the platform and that comes in the form of trail head. So, just there's a lot of online resources where they're able to learn. If you're looking for something more advanced, we do have um options that do come at additional cost, whether that's class courses or if we wanted to look at signature success down the road, which I think would be a bit advanced for where you're at today. that premier success should really just be a strong foundation for getting kicked off with the platform and locking in that um full support that you're looking for and would need out the gate as you're working with the partner and getting set up and comfortable. Any questions on kind of those takeaways or the pricing so far?

**Rodrigo Zyris:** Can you expand a bit on the bullet point that says 50 workflows, 5 million messages, two pre prepro and two product manage APIs.

**00:41:27**

**Rodrigo Zyris:** Can you explain which one of these items actually

**Sam McKay:** I can uh I can touch on that Paris add some color there.

**Rodrigo Zyris:** means?

**Sam McKay:** Uh so a flow Rodrigo in Mulesoft is essentially uh a pipeline that is moving a certain type of data between systems. So when we're talking about for example the merge event from HubSpot and that flowing into other systems, setting up the pipeline that receives those merge events and passes it along. That's one flow. Uh now if we're talking about the batch job that's going to take customers from HubSpot and

**Rodrigo Zyris:** Mhm.

**Sam McKay:** move that into um FO that would be another flow.

**Rodrigo Zyris:** Uhhuh.

**Sam McKay:** So so it's not just system to system equals one flow but it gets a little more granular than that. It's really more about like the triggers. So the unique triggers uh you can think of as the entry points for flows. So that's where the 50 flows comes in and that's uh generally split across a pre-production and production environment. So we did some sizing uh we ran through kind of that uh illustrative uh API diagram that we were looking at.

**00:42:31**

**Sam McKay:** Uh we feel that 50 flows would more than cover the use cases that we've discussed um for you today. 5 million messages every time a flow is triggered that's a message. So when we're talking about a batch job, let's say that runs once an hour, every time that runs, even if it queries and picks up a thousand records, that's only going to be one message. Now, if someone hits the button to sync a record,

**Rodrigo Zyris:** Uhhuh.

**Sam McKay:** that's also one message. So it's really just about uh how many times the flow is triggered, that's a message. So again,

**Rodrigo Zyris:** Mhm.

**Sam McKay:** five five million messages not, you know, concerned on that front.

**Rodrigo Zyris:** And that's a year, right?

**Sam McKay:** That's a year.

**Rodrigo Zyris:** Or Yeah.

**Sam McKay:** Yes.

**Rodrigo Zyris:** Okay.

**Sam McKay:** And then uh to touch on the managed APIs piece of it, uh a managed API is an API that you're actually applying security policies to. So like if you want to add client ID enforcement, if you want to add ooth to an API, you would be using one of those managed APIs to do it.

**00:43:29**

**Sam McKay:** Uh generally for the use cases that we've discussed, you wouldn't need that. for example, the batch process, grabbing things from HubSpot, bringing it into FO, that's not an API that a system is calling. That's a scheduled job that's running. So, you don't really need to worry about uh adding client ID enforcement to a process like that.

However, when we're talking about uh the merge event or like a web hook coming from a system, that's something that's going to come from an outside system and hit Mulesoft, you would want to put some security on that, whether that's an IP whitelisting, a client ID enforcement, something like that. So again, uh for your use cases that we've discussed today, uh two prepro, two prod managed APIs uh should be more than sufficient for those use cases.

**Rodrigo Zyris:** Do we have any limit on the number of connectors that we can use from your exchange or we can Yeah.

**Sam McKay:** So uh uh all the connectors that uh come with this uh package you're able to use. There's no like limit on the amount of connectors.

**00:44:22**

**Rodrigo Zyris:** Anyway,

**Sam McKay:** We do have some premium connectors that are add-ons, but none of them would be relevant for the uh use cases that we've discussed. They're more for like very specialized uh uh niche use cases. So long and the short of it is you can use as many connectors uh as you want uh with this package.

**Rodrigo Zyris:** and the discounted annual cost that's for the first year only or does it uh Uh that's our pricing moving

**Paris Thomas:** So that'll be your pricing moving forward.

**Rodrigo Zyris:** forward.

**Paris Thomas:** SA uh Salesforce does have a standard uplift on renewals which is 9% but this will be the rate that you're locking in and any renewal negotiation will go off of this price

**Rodrigo Zyris:** All right.

**Paris Thomas:** point.

**Rodrigo Zyris:** Awesome.

**Sam McKay:** Just one more thing I wanted to add real quick, Paris, because I know uh Rodrigo you were asking about um kind of like learning material and like scaling up on the platform. And I know we've touched on your success and that that's a super helpful resource. We also do have free trail head courses which is kind of like Salesforce's learning platform that go over the Mulesoft platform and teach you the fundamentals.

00:45:31

**Sam McKay:** When I graduated from university uh and started as a Mulesoft developer, that's how I learned the platform. uh and it was enough to get me you know up to speed get certified on the platform and and literally making it my career after that. So there there is a lot of free material available to uh skill your developers up.

**Rodrigo Zyris:** Nice.

**Paris Thomas:** Great.

**Rodrigo Zyris:** Nice.

**Paris Thomas:** Um, wonderful. Any other questions,

**SF-Tower (23, C03):** Yeah.

**Paris Thomas:** Rodrigo, on kind of what the capacity looks like on support? Any questions

**Rodrigo Zyris:** Uh, I don't believe so.

**Paris Thomas:** there?

**Rodrigo Zyris:** Alex, do you have anything?

**Alex Ichikawa:** No,

**SF-Tower (23, C03):** So,

**Rodrigo Zyris:** Yeah.

**SF-Tower (23, C03):** so one thing I do want to touch on here,

**Alex Ichikawa:** nothing.

**SF-Tower (23, C03):** Rodrigo and Alex, is is that uh February Premier Success Promotion, that's a free package that's included here only for the month of February. Uh February is our first month of the fiscal year. January was the end of our fiscal year.

00:46:31

**SF-Tower (23, C03):** And a lot of our customers know like every month comes with like some kind of promotion. uh this month happens to be like Mulesoft and Premiere. There's also a separate solution. I won't even bring it up since it's not part of this conversation, but um just letting you guys know like uh Premier success plan comes with

**Alex Ichikawa:** Thank you.

**SF-Tower (23, C03):** um like it comes with like health check assessments, expert coaching sessions. Uh you get the 247 365 support, unlimited support for you guys. Um, but this is part of that free pro free packet or promotion that's uh free and included uh for the Anyoint platform for the month of

**Rodrigo Zyris:** And for how long do we have access to the premier success for

**SF-Tower (23, C03):** February.

**Paris Thomas:** So you'll have clear success for the extent of your contract with Mulesoft

**Rodrigo Zyris:** lifetime?

**Paris Thomas:** and we can include that when it does come to renewal. So that'll be baked in throughout the year to have access to that

**00:47:32**

**Rodrigo Zyris:** Yeah,

**SF-Tower (23, C03):** Yeah.

**Rodrigo Zyris:** that is very good.

**SF-Tower (23, C03):** And this is Go ahead.

**Paris Thomas:** support.

**SF-Tower (23, C03):** I'm sorry.

**Rodrigo Zyris:** I said that the premier success actually adds a lot of value to the

**SF-Tower (23, C03):** Yeah.

**Rodrigo Zyris:** dealers.

**SF-Tower (23, C03):** Typically a Premier Success is 30% of uh of the actual contract.

Um but here it's it's included for the month of February only for the month of February.

**Rodrigo Zyris:** Mhm.

**SF-Tower (23, C03):** And what's great about these premier success plans,

**Rodrigo Zyris:** Uh-huh.

**SF-Tower (23, C03):** it's after you're done with implementation, this is when it it just takes off and skyrockets. This is when you're able to leverage it after you're already set up. You know, call or or set up meetings with expert train uh ex uh the technical uh experts at Salesforce. Um I mean, we're we're here to literally guide you best practices, maybe create different fields, maybe you have a future vision for another integration. Like that's that's the beauty of these success plans.

**00:48:29**

**Rodrigo Zyris:** Mhm. Yeah. Yeah, it sounds great. If I can get the quote like in a PDF just so I have documentation of it, I would appreciate and if you can put me in contact with a partner that can do the

**Alex Ichikawa:** You see what?

**Rodrigo Zyris:** initial implementation for us. That would also be great. And I should have uh by the end of the week I should have an answer. But we are happy with what we saw. Alex and I were lacking during the meeting and he was actually impressed with it. So, it's good.

**Paris Thomas:** Great. Wonderful. I'm so happy to hear that, Alex. You're into it.

**Rodrigo Zyris:** Yeah.

**Paris Thomas:** We like it.

**Alex Ichikawa:** Yeah, looks good. Um, I like what I saw.

**Paris Thomas:** Great. Um, all right. So, this is what we'll do. Rodrigo,

**Alex Ichikawa:** adaptive.

**Paris Thomas:** Alex, we'll get over a draft quote with this pricing on there and then we'll get an intro going with a partner.

**00:49:27**

**Alex Ichikawa:** I'm

**Paris Thomas:** What just want to be clear here,

**Alex Ichikawa:** gonna

**Paris Thomas:** partners are like we talked about on the last call, they are third party. They do come with their own associated investment. Um,

**Alex Ichikawa:** survive.

**Paris Thomas:** so you got the intro going for maybe Thursday.

**Rodrigo Zyris:** What?

**Paris Thomas:** Does that do you want to meet with them first and walk through everything and we can send over all of this for kind of an initial so coming into that call or what would you like to do?

**Rodrigo Zyris:** uh you can send the initial information and we can meet with them and and go through like the actual requirements. So

**Paris Thomas:** Okay. And is there the that partner alignment and S so going to be have an impact on an

**Rodrigo Zyris:** yeah,

**Paris Thomas:** ability for us to move forward with this in

**Alex Ichikawa:** You can This

**Rodrigo Zyris:** uh I would like to have some touch point to the the the partner

**Paris Thomas:** February.

**Rodrigo Zyris:** first to make sure that we have someone that understands some

requirements that we had that would help us moving forward.

**Alex Ichikawa:** Father,

**Paris Thomas:** Okay.

**Rodrigo Zyris:** uh we like the platform regardless like it's just like I know we will have uh hopefully the first partner that we meet is a match you know

**Paris Thomas:** Yeah. Okay, great. Well, let's do this.

**Rodrigo Zyris:** so

**Paris Thomas:** Do you guys have availability maybe on Thursday and we can get a call going with someone from our partner teams?

**Rodrigo Zyris:** yes so let See, Thursday, we have the morning wide open from 9:00 a.m. to

**Paris Thomas:** I'm gonna do this.

**Rodrigo Zyris:** 12.

**Paris Thomas:** Uh, Rodrigo, let me put a hold for that time and just connect partner,

**Rodrigo Zyris:** Uh,

**Paris Thomas:** get their availability, and then I'll update that.

**Rodrigo Zyris:** awesome.

**Alex Ichikawa:** is

**Paris Thomas:** Okay.

**Rodrigo Zyris:** Yeah.

**Paris Thomas:** All right. Anything else you guys need from us?

**Alex Ichikawa:** lower.

**Paris Thomas:** Can we send anything over other than the draft order form?
